

# Layouts

A **Layout** is created to control the placement of the content on the screen. It contains a composition of different sections.

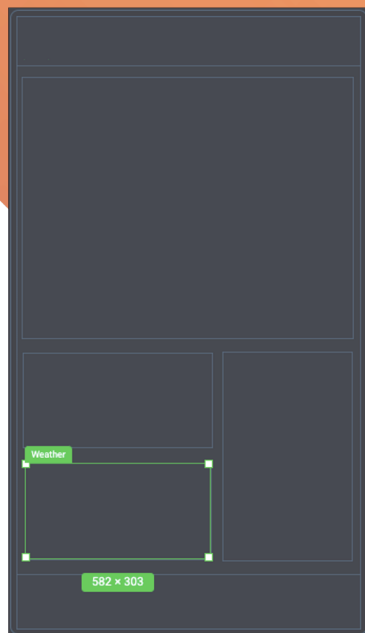

A layout can have one or more sections of different sizes. The sections are places within the screen area and then filled with content such as images, videos or text.

It is even possible to create playlists with different content in each section

## Moving sections

It's easy to form and move sections around to where they should be

When a section is marked, it is marked with a green frame. It is then possible to drag it, resize and reformat the section as desired.

## Layering

All sections created are placed in a list on the right pane

The list acts as a layered container. If there are 2 sections in the same area, then the one higher up in the list will be the visible one
