Scenes

A Scene is created to be published on one or more screens. A Scene that is finished includes everything that will be shown on a screen during the time it is published.

Anytime you'd like to publish content to a screen, you need to first create a Scene

A Scene should have the same format as the screens it will be published to. It'll contain a layout that in turn contains one or more sections

Content can be added to sections, such as images, videos and text. You can even create playlists with different content in each section

Scene with an empty layout

A layout with 7 sections without content

After creating a Scene, the next step is to generate a layout. This is done by creating and placing sections as below complete with content. The image below is a Scene with a Layout that consists of sections without content

Scene with a filled layout

A Layout with 7 sections complete with content

Each section can play one or more types of different content. If there are different types of content that will be played in a section, then a playlist is created. The image below shows a scene with a where the sections contain content
